Integrating ICT, New Technologies and AI Tools into Teaching and Education

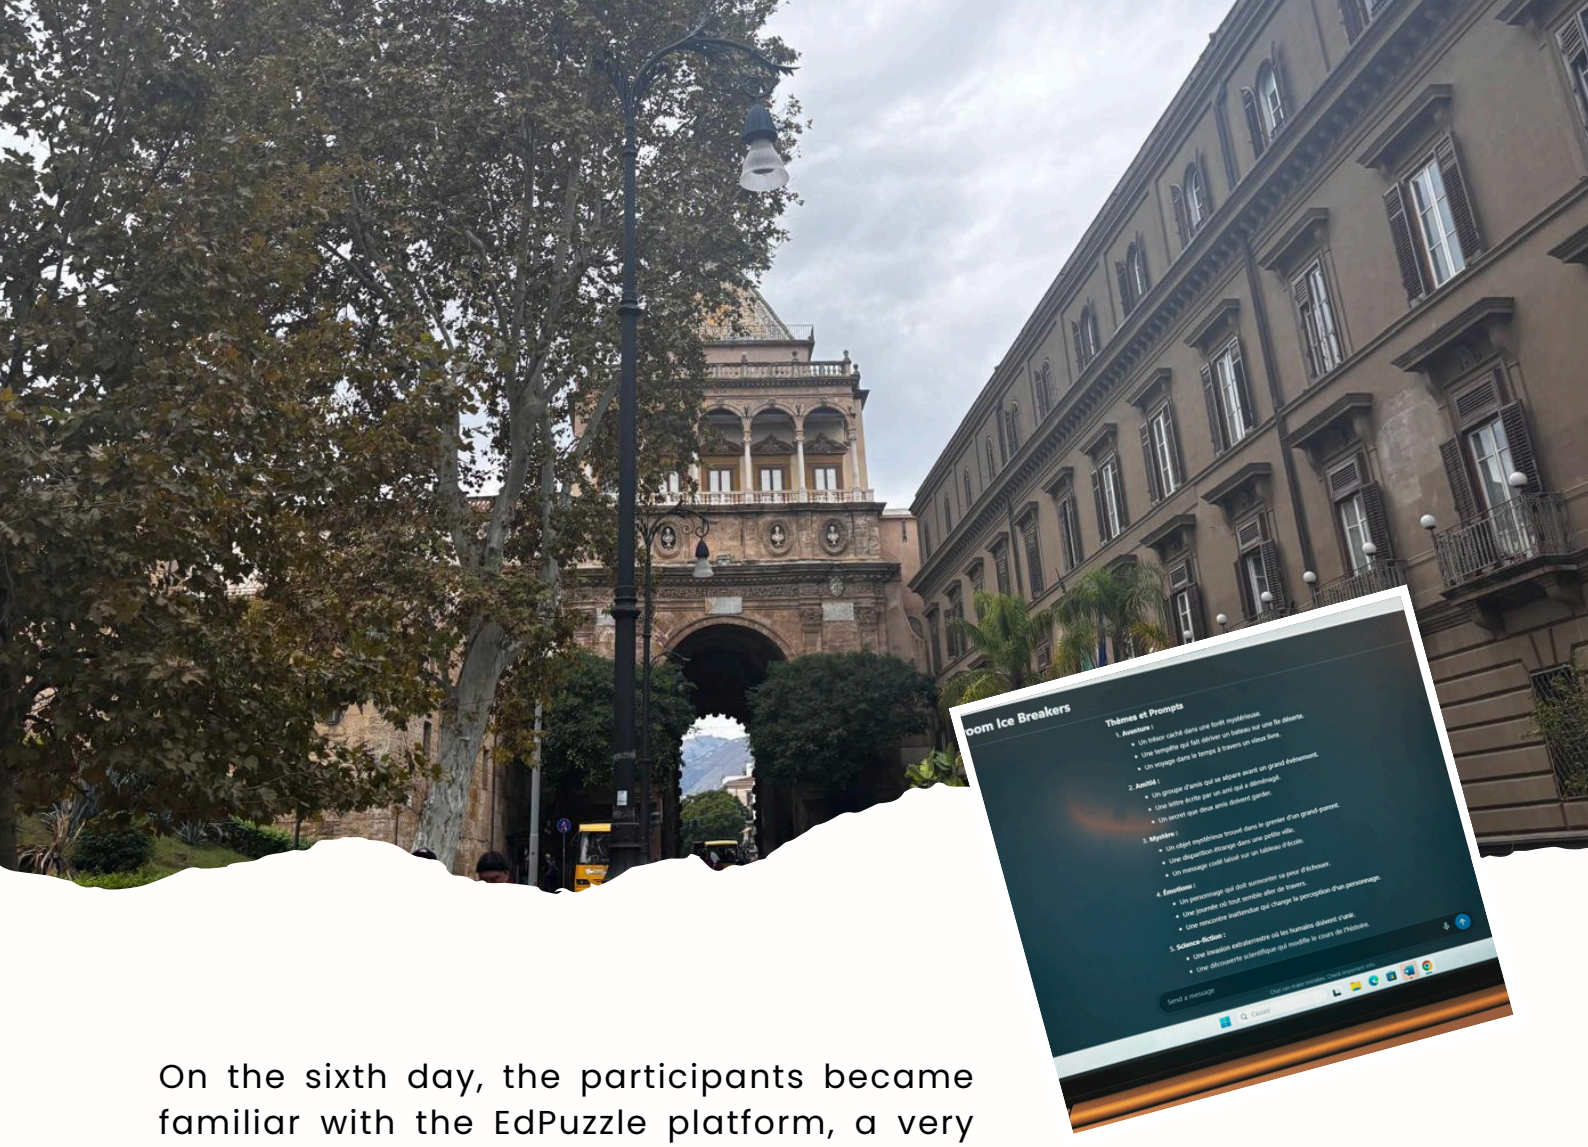
Between the 10th to 16th of November 2024, three teachers took part in the course Integrating ICT, New Technologies and AI tools into Teaching and Education, organized by the Erasmus Learning Academy in Palermo, Italy.

On the first day of the mobility, the group participated together with other teachers from Germany, Ireland, Lithuania, Estonia, Sweden, Norway and Poland at the opening ceremony, which included the presentation of the course, each teacher participating in the course, the school they come from, the innovative projects implemented in each school. This was followed by some icebreaking activities, as well as the virtual tour of the city of Palermo, prepared by the teacher trainer, Giulia Amato.

The second day started with theoretical notions that focused on team building exercises, exploring the latest trends in integrating new technologies and web platforms in education. The virtual whiteboard and collaborative platforms, as well as hands-on work, transforming the device into a virtual whiteboard with AI-enhanced elements, and managing a blog page have broadened perspectives and facilitated constant knowledge sharing. The theoretical part was doubled by the applicative part, with teachers being guided by useful applications for school such as Mentimeter, Ziplet, Nearpod, online tools that allow teachers to use slide-based teaching both in the classroom and remotely, thanks to a hybrid layout. Teachers can thus create a lot of interactive learning resources that allow students to engage in the activity and learn through their device or a single screen in the room.

On the fourth day of the mobility, the Erasmus team put into practice testing and practicing some of the most common game-based learning tools, creating outstanding multimedia content – design, presentations, social media graphics, posters, collages. Starting from well-defined objectives, each teacher planned and outlined a project specific to each taught discipline that he presented to the audience.

The fifth day began with practical work - creating a visual, virtual experience based on artificial intelligence. In teams, teachers worked on creating a model lesson. The lesson planning was supported by artificial intelligence, the use of ChatGPT with the aim of promoting engaging and adaptable language learning. Starting from the key question How to impress and engage students, interactive images were created, with a table of contents and interactive presentations supported by the Magicschool and SchoolAI platforms.



On the sixth day, the participants became familiar with the EdPuzzle platform, a very useful and easy-to-use support, through which teachers can turn any video into a lesson.
With just one click, video lessons created by other teachers can be found, including formative assessment. The teacher can adapt that video by incorporating their own questions or audio

The seventh day started with discussions about the skills acquired, followed by the evaluation of the course and the end ceremony of the mobility at the end of which each student was handed the certificate of participation. In a very pleasant atmosphere, each participants thanked the hosts for this special and interesting experience, both from an educational and cultural point of view. This Erasmus+ mobility was an opportunity for each participating teacher, a great experience that contributed to improving intercultural and communication skills in English.
